The master's thesis “Landscape Zoning and Water Supply Problems of Tbilisi” discusses the general geographical features of water supply in Georgia, water resources and forms of monitoring their quality. Criteria for assessing the quality of drinking water and the possible consequences of drinking water unsuitable for human consumption.

All the landscape zones that Tbilisi includes are highlighted and characterized in the work. Zones are considered by aspects such as climate, geographical location, population density, vegetation cover and more. The forms of Tbilisi landscape protection are presented.

In addition, the paper focuses directly on the geographical features of Tbilisi's water supply. On the specific resources or locations from which water is supplied to the capital. The main problems related to Tbilisi's water supply and ways to solve them are highlighted.
